

Q6 - Simple Library Book Counter Guide

Python Solution (library.py)

```
def total_books(shelves):
    return sum(shelves)

def average_books(shelves):
    return sum(shelves) / len(shelves)

def max_shelf(shelves):
    return max(shelves)

if __name__ == "__main__":
    shelves = [12, 8, 15]
    print(total_books(shelves))
```

Expected Output

35

Git Commands

```
git add .
git commit -m "Added Q6 Library Tracker Program"

git checkout -b feature-average-books
# Add average_books()
git add .
git commit -m "Added average_books function"

git checkout main

git checkout -b feature-max-shelf
# Add max_shelf()
git add .
git commit -m "Added max_shelf function"

git checkout main

git merge feature-average-books
git merge feature-max-shelf

git push origin main

# Delete local branches
git branch -d feature-average-books
git branch -d feature-max-shelf

# Delete remote branch
git push origin --delete feature-max-shelf

# If Git refuses to delete a branch because it is not fully merged:
git branch -D feature-max-shelf
```

Note

Use 'git branch -D' only when you intentionally want to force-delete an unmerged branch. Git blocks the normal '-d' option to prevent accidental loss of commits that have not been merged.
